Host a Website

Host a Website

ZeroTier enables private networking between devices, allowing you to host a website locally and serve it securely to peers on the same ZeroTier network.

Prerequisites

- A working ZeroTier network with 2 or more devices, per the [ZeroTier Quickstart Guide](#)

Step 1: Run a Local Web Server

Choose your platform and follow the steps to start a simple web server:

Windows

MacOS

Linux

Open Terminal in your site directory and run:

```
python3 -m http.server 8080
```

If prompted, allow the connection through the firewall.

Step 2: Access the Website

On another device in your ZeroTier network:

- Open a browser.
- Navigate to:

```
http://<ZeroTier IP of host>:8080
```

Next Steps

By default, Python searches for a file `index.html` in the directory you are running the website from to act as a homepage. To customize your site, create and modify this file. Find out more about [Python HTTP Servers](#).

Other options for self-hosted HTTP sites include:

- [Apache HTTP](#) (`sudo apt install apache2`)
- [Nginx](#) (`sudo apt install nginx`)
- Node.js-based servers

Just configure them to listen on your ZeroTier IP or all interfaces (`0.0.0.0`).
