OpenWRT

Advanced Configuration

The **OpenWRT Project** is a Linux operating system targeting embedded devices.

ZeroTierOne is available as a package from the primary OpenWRT project, as well as many OpenWRT-based platforms including **Teltonika RutOS** and **GL.iNET** portable routers.

To install and configure ZeroTierOne on OpenWRT, please see the **main project wiki**. That page includes guidance on not just the initial setup, but how to configure other router and firewall options to handle traffic across the ZeroTier network(s) for your environment.

Advanced Configuration

As noted in the wiki article above, you can set a number of basic ZeroTierOne settings via UCI configuration values, either by editing the file `/etc/config/network/zerotier` or using the LuCI web interface.

However, some features require manual configuration:

- Hosting a ZeroTier controller on your OpenWRT device requires a writable filesystem location to store controller state (such as authorized members) using the `config_path` option
- Overriding options in `local.conf` such as `lowBandwidthMode` requires creating a valid local config file and then setting `local_conf` in the UCI configuration to point to it.
