Remote Desktop

ZeroTier doesn't care whether your connected device is next to you or away at the office - a remote desktop connection has never been easier. Let's get started.

Prerequisites

- A working ZeroTier network with 2 or more devices, per the [ZeroTier Quickstart Guide](#)

Enable and Connect to Remote Desktop

Windows

MacOS

Linux

There are several options for remote access on Linux, depending on whether you need a terminal or a GUI.

SSH (Terminal/CLI Access)

Install SSH (if not already installed):

```
sudo apt install openssh-server
```

Next, start and enable the SSH Service. This is on the device that will be connected to, called the "server".

```
sudo systemctl enable --now ssh
```

Note down your server's credentials (user name/password). Then, connect from either Windows Powershell, MacOS Terminal (SSH installed by default), or another Linux machine with SSH:

```
ssh <username>@<ZeroTier-IP>
```

Enter password when prompted. Leave blank if no password.

You should now be securely connected via SSH!
