USB Device Sharing with VirtualHere

VirtualHere allows you to remotely access and share USB devices - keyboards, Point of Sale devices, and many more - over a local network.

When paired with ZeroTier, VirtualHere enables secure and seamless USB device sharing between connected machines, even across different physical locations.

How It Works

- Install VirtualHere USB Server on the machine with the physical USB device.
- Install the VirtualHere USB Client on the receiving machine.
- Connect to the host using the **ZeroTier IP address** of the USB server.
- Select and use the shared USB device as if it were plugged in locally.
